MP1590B

Network Performance Tester

All-In-One Next-Generation Network Testing
## SDH/SONET/OTN/PDH/DSn/Jitter/EoS/Ethernet/IP Analyzer

The dawn of the NGN era and the spread of high value-added and seamless networks are driving the need for high-level testing and evaluation of these networks and their network devices.

Using modular plug-in units, Anritsu's MP1590B supports performance, jitter, and EOS measurements of networks, equipment and devices with SDH/SONET/OTN/PDH/DSn interfaces. The MP1590B also supports both Ethernet and IP technologies with a variety of applications such as QoS and IPTV streaming service tests.

This tester family is the perfect tool for performing the wide range of measurements covering the physical to application layers needed for constructing next-generation networks.

- ■ **Simultaneous Multichannel Measurement**

- ■ **An all-in-one instrument for measuring SDH/SONET/OTN/PDH/DSn/Jitter performance**

- ■ **Supports EoS (GFP, VCAT, LCAS, Differential Delay) measurements**

- ■ **Supports 10/100/1000M, Gigabit, and 10 Gigabit Ethernet measurements**

Main Applications

SDH/SONET/OTN/PDH/DSn/10G Ethernet Performance Measurements

The MP1590B supports ITU-T, Telcordia and IEEE compliance tests of 1.5M to 11.1G SDH/SONET/OTN/PDH/DSn/10G Ethernet equipment. The following functions can be used to evaluate the performance of networks, equipment, and devices supporting these standards:

• Multichannel Measurement
• Error/Alarm Measurements
• Alarm Detection and Removal Conditions Setting Function
• Delay Time Measurement
• APS (Automatic Protection Switching) Measurement
• Through Mode Function
• Overhead Editing Function
• Monitor Functions
• Unframe BER Measurement
• Variable Frequency Offset Function
• FEC Performance Measurement
• 10G Ethernet Measurement

Sending remote control commands via the Ethernet/RS-232C/GPIB interfaces makes it easy to configure a customized measurement environment for maintenance, installation, R&D, and manufacturing.

Different bit rates can be specified for MP1590B Tx and Rx signals. This means that line- and client-side equipment and networks can be tested simultaneously, supporting configuration of an efficient measurement environment.

SDH/SONET/OTN Jitter Measurements

Jitter is a key index expressing the performance and quality of SDH/SONET and OTN transmission equipment and devices. Jitter evaluation is also an important part of assuring interoperability and network stability.
The MP1590B supports the following ITU-T and Telcordia-compliant SDH/SONET/OTN measurements from 52 Mbit/s to 10.7 Gbit/s:

• Jitter Generation Measurement
• Jitter Tolerance Measurement
• Jitter Transfer Measurement

The user can set any mask standard values for these measurements. Because the MP1590B supports optical, electrical and electrical differential (10G band only) interfaces, network equipment jitter as well as device and optical module jitter can be measured. In the 10G band, jitter measurement of 10.3 Gbit/s transfers used by 10G Ethernet can be measured.

DUT

MP1590B

When required, a high-accuracy jitter measurement option can be installed in the MP1590B to perform high-accuracy and high-repeatability measurements with calibration based on Appendix VIII of the April 2005 ITU-T O.172 standard. But even without this option, jitter measurement is still in full compliance with the April 2005 ITU-T O.172 standards.

See page 8 for details of individual functions, page 14 for the list of functions and supported mappings, and page 18 for the specifications of the main frame and plug-in modules.
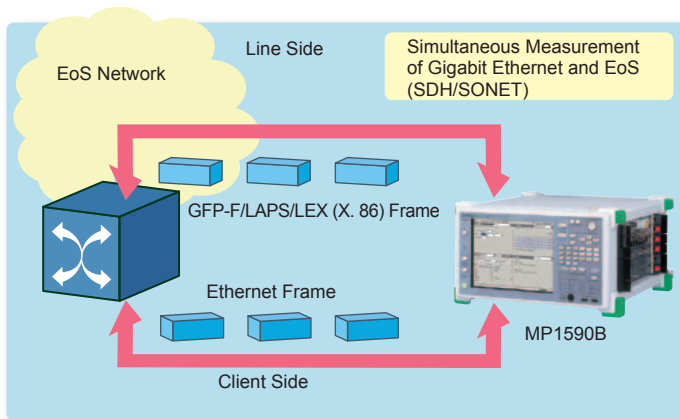

Anritsu is a proactive member of the ITU-T standardization working groups and has extensive knowledge and practical experience of jitter measurement that is incorporated in the MP1590B.

EoS (Ethernet over SDH/SONET) Measurements

The MP1590B supports the following measurements for next-generation SDH/SONET:

• GFP-F, LEX, LAPS (X.86), PPP Encapsulation
• Virtual Concatenation Member Editing Function
• Virtual Concatenation Group (VCG) Auto-detect Function
• Differential Delay Add/Monitor Function
• LCAS Autonegotiation Function
• LCAS Sequence Generation/Capture Function
• Path Monitor Function

See page 9 for function details.

MP1590B

Client Side

The following measurements are supported because the MP1590B can generate GFP-F, LEX, and LAPS (X.86) encapsulated EoS frames, even when VLAN tags and IP and TCP/UDP headers are attached. Adding an Ethernet unit to the configuration enables a seamless client- and line-side measurement environment using only one main frame.

In addition to EoS measurements, the MU150101A 2.5/2.6G EoS Unit used here also supports POS measurements and performance measurements of 1.5 Mbit/s to 2.6 Gbit/s SDH/SONET/OTN/PDH/DSn, facilitating a wide range of applications.

See pages 13 and 14 for the list of functions and supported mappings, and page 18 for the specifications of the main frame and plug-in modules.

By taking advantage of the Ethernet module functions listed on the right, they can also be used as genuine IP testers for Ethernet interfaces. See the MD1230 family catalog for the individual Ethernet module specifications.

The MP1590B supports all the key tests of devices and networks, such as load tests, performance tests, traffic measurements, and packet analysis. They can also be used for IPV6 measurements, RFC2544/RFC2889 auto-measurements, auto-negotiation analysis, Ethernet OAM emulation, and more.

Individual Applications

SDH/SONET/OTN/PDH/DSn/10G Ethernet Performance Measurements

Multichannel Measurement

SDH/SONET signal channel configurations ranging from STM-0/OC-1 to STM-64/OC-192 are detected automatically and the performance (errors, alarms, BER, APS, delay time) of all channels including both high and low order (max. 5,376 channels at VC11/VT1.5) can be measured simultaneously, supporting correlation confirmation between channels as well as greatly reduced measurement times.

Mapping Auto-search Screen

Error/Alarm Measurements

Errors (such as FAS, BIP-8, and B1/B2/B3) and alarms (such as LOF, LOM, and AIS) can be generated at any timing and counted or monitored by the MP1590B for stress testing SDH/SONET and OTN equipment.
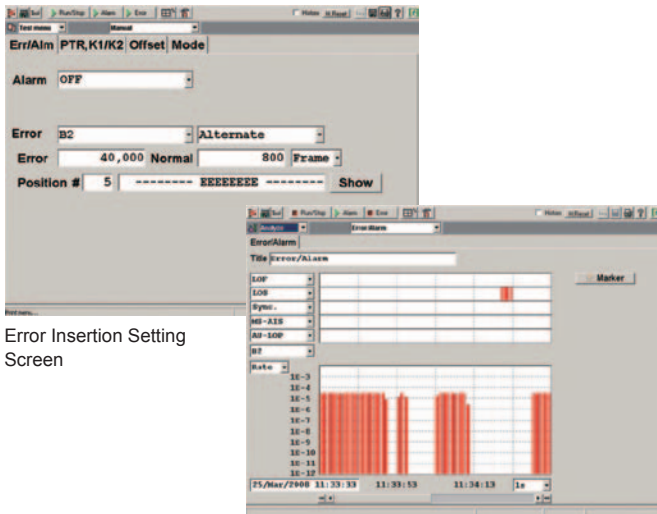

Error Insertion Setting Screen

Error Monitor Screen

Alarm Detection and Removal Condition Setting Function

This function changes the conditions for detecting and removing alarms, making it easy to stress test ITU-T and Telcordia-compliant equipment and networks. This greatly simplifies fault testing.

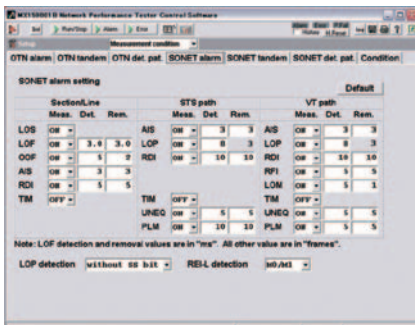

Delay Time Measurement

Network delay is known to be a key factor that directly impacts network quality. This measurement supports measurement of payload data transmission quality to the order of 0.1 μs.
APS Measurements

The Auto Protection Switch (APS) test function checks of equipment switching time with 0.1 ms resolution. The switching time until the fault condition triggered by an error or alarm is released can be measured to check standards-compliant rerouting caused by faults.

Through Mode Function

The MP1590B Through mode can be used for all supported bit rates. Connecting devices using this mode allows monitoring the actual signal quality as well as inserting various errors and alarms into the circuit path.

– Transparent Mode –

In this mode, the received signal is looped back as is which is useful for emulating the transmission path because bit error insertion is supported.

MP1590B

– Overhead Overwrite Mode –

In this loopback mode, the overhead part of the received SDH/SONET/OTN signal can be overwritten with a new overhead specified by the MP1590B in order to emulate various errors and alarms that can occur in actual circuits.

Overhead Editing Function

Tx frame overhead can be changed easily to simplify stress and fault testing of ITU-T and Telcordia-compliant equipment and networks.

Monitor Function

Networks are easily monitored using a full line-up of versatile functions for monitoring errors/alarms, frequency, pointers, overhead, optical output power, and more.

Variable Frequency Offset Function

The MP1590B supports variation of the Tx clock in 0.1 ppm steps over a range of ±100 ppm. They can also send signals synchronized with an external clock source to perform device and network stress tests using degraded clocks exceeding the ITU-T and Telcordia specified ±20 ppm frequency range.

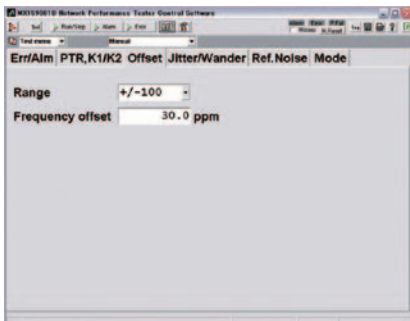

FEC Performance Measurement (OTN-specific)

This function for inserting Poisson-distributed random errors specified by ITU-T O.182 supports easy and high-reproducibility validation of the error-correction performance of FEC decoders, avoiding the use of external equipment such as noise generators. Burst error insertion provides an efficient method of validating FEC burst-error correction performance.

**Random Error Insertion using O.182 Method.**
This function is required for FEC evaluation. Accurate measurement was impossible using previous error insertion method.

10G Ethernet Measurement

The quality of 10G Ethernet equipment and networks can be evaluated by measuring throughput, BER, sequence errors, and latency. In addition, detailed analysis of the 10G Ethernet Physical layer is supported by functions including measurement of the 64B/66B encoding used by the PCS (Physical Coding Sublayer) layer, LFS (Link Fault Signaling) which performs warning notifications at faults, clock frequency variations, optical power, etc.

SDH/SONET/OTN Jitter Measurements

Using the MU150125A 10/10.7G Jitter Unit supports jitter generation and measurement for SDH/SONET/OTN 52 Mbit/s to 10.7 Gbit/s equipment. Jitter of optical modules such as XFP can be measured by adding options supporting 10.3G.

■ Jitter Measurements
There are three types of jitter measurement, depending on the purpose, as shown below. The MP1590B simplifies each of these measurements.

• Jitter Generation Measurement
The jitter generated at the output side of equipment and devices is measured to check that it is better than the standard value established by ITU-T and Telcordia.

• Jitter Tolerance Measurement
The jitter tolerance at the input side required for equipment and devices to operate normally is measured to check that it is better than the standard value established by ITU-T and Telcordia.

• Jitter Transfer Measurement
The jitter attenuation characteristics between the jitter input to equipment and devices and the output side is measured to check that it is better than the standard value established by ITU-T and Telcordia.

There is a correlation between jitter generation and jitter tolerance measurements: if both meet the standards, network connection compatibility is assured. Jitter transfer characteristics are a standard for curbing accumulated jitter caused by each unit of connected transmission equipment. Jitter transfer can be a major issue when there is a large number of elements in a long-distance network.

■ High-Accuracy Jitter Measurements
The MP1590B support a high-accuracy jitter measurement (Option-30) for performing calibration based on the true jitter measurement standard outlined in Appendix VIII of the ITU-T O.172 standard. Installing this option suppresses randomness in the generated jitter to ±5 mUI, permitting high-accuracy and high-repeatability jitter measurement.

Note 1:
This option can be added to the main frame before delivery. But it cannot be added after.

Note 2:
This option assures high-accuracy jitter measurement only when the factory installation conditions remain unchanged. If a plug-in unit installed along with Option-30 is subsequently replaced or removed, or if another plug-in unit is installed, high-accuracy jitter measurement is no longer assured. However, the function and performance of other measurements (excluding high-accuracy jitter measurement) are still assured.

Note 3:
This option requires periodic calibration at shipment and annually thereafter.

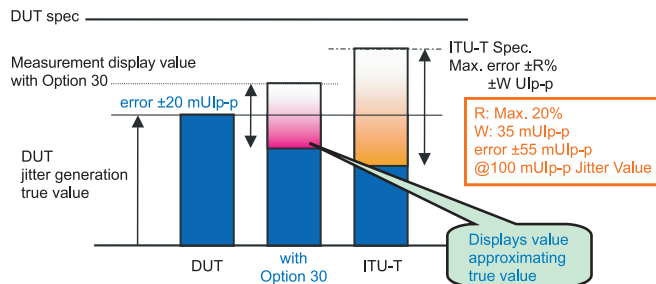

■ Differential Electrical Interface
Using the MU150121B/23B/24B modules with differential electrical interfaces for 9953M, 10.3G and 10.7G rates supports jitter measurement of the electrical differential interface of optical transceiver modules, such as XFP modules.

Conventionally, jitter measurement of electrical interfaces is performed using framed signals for single-end electrical interfaces. However, measuring the jitter of an optical transceiver module, such as an XFP module, with such single-ended electrical differential interfaces causes large variations in the jitter amount due to the impact of polarity and test patterns. This prevents accurate jitter measurement.

Consequently, it is essential use a differential electrical interface for jitter measurement.

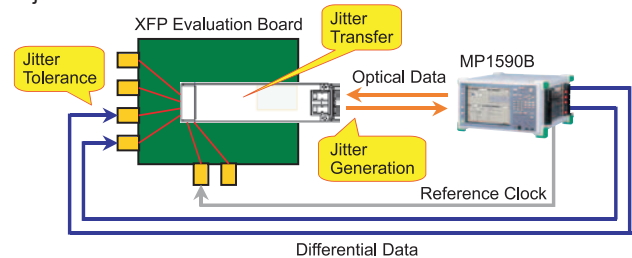

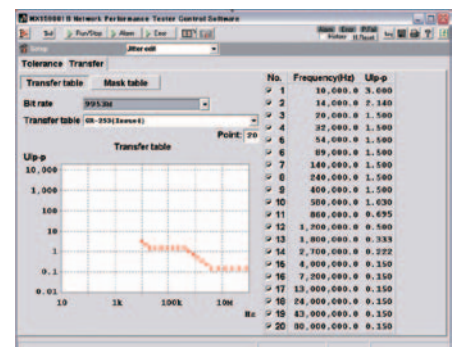

■ User Mask Settings
The MP1590B can set masks defined by the ITU-T and Telcordia standards as well as any user-defined masks, such as masks with standards-compliant margins.

EoS (Ethernet over SDH/SONET) Measurements

Virtual Concatenation (VCAT)

Both high and low-order VCAT are supported. The Virtual Concatenation Group (VCG) can be set for any member position (Channel) and sequence (SQ). Using the VCG auto-detection function allows the tester to capture connected VCG settings easily.

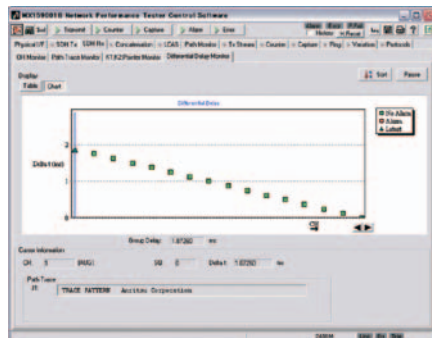

Differential Delay

The differential delay monitor function makes it easy to see the delay status and correlations of each VCG member at a glance. Furthermore, the differential delay generation function supports individual addition of a delay up to 512 ms to each VCG member. There are two built-in delay insertion methods: the Direct mode, in which the new delay is activated as soon as the delay value is input; and the Sweep mode, in which the current delay value is switched to the new input delay value after some period of time as sweeping progresses. Using the Sweep mode supports verification of equipment differential-delay tolerance under conditions emulating a real network where the status changes continually. This function supports both pear-to-pear and through-mode connections.

The differential delay settings support On/Off and sweep amount for each channel, with two target delay settings for configuring a near-to-live network environment.

LCAS

LCAS emulation, sequence generation, monitor, capture and summary functions are all built-in. The LCAS generation function can generate a maximum of 64 sequences for easy evaluation of functions using multi-LCAS sequences. The LCAS capture function captures a maximum of 64 sequences for detailed analysis of LCAS sequence operations.

Path Monitor Function

This function supports individual monitoring of errors and alarms for all VCG members. It can be used for detailed analysis to confirm whether an error has occurred during EoS, virtual concatenation, and LCAS measurement. It can also check the member at which the error occurred.

Ethernet Performance Measurements
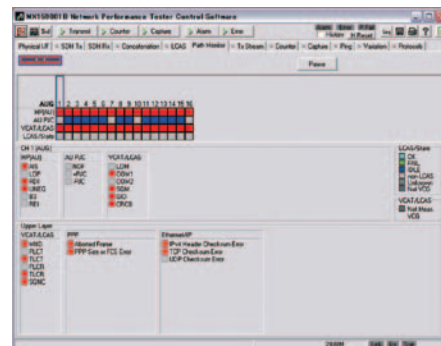

Load Tests

Stream Generation

This function makes it easy to generate multiflow packet streams and full-wire-rate high-load traffic, which are difficult to achieve manually in a real network environment.

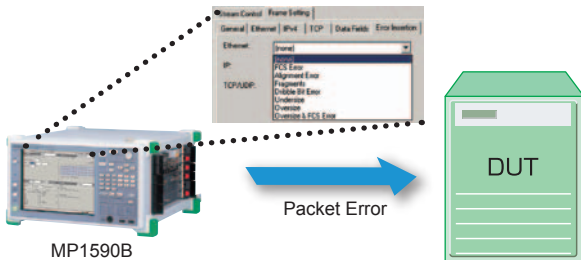

Variable Clock Offset

A variable clock offset function for sending signals to network equipment is built in and supports clock tolerance measurements of equipment and devices.
Error Addition

This function adds packet errors to the Tx stream for creating easily reproduced fault conditions.

Traffic Impairment Emulator

This function emulates network impairments such as packet loss, errors, and delay that occur in real IPTV and VoIP traffic. It is used to evaluate service quality by assuming various types of network impairments.

Traffic Measurements

Counters

A full lineup of various counters supports traffic measurements by helping detect various network faults.

Multiflow Counter

Simultaneous monitoring of various traffic conditions (throughput, delay, frame loss) helps validate QoS controls and verify their effectiveness.
High-Resolution Traffic Monitor

Current measurement methods with a 1-second resolution are inadequate for verifying burst data impacting the quality of streaming services. This function performs monitoring with 1-ms time resolution to analyze burst data with previously unachievable accuracy for assured service quality.
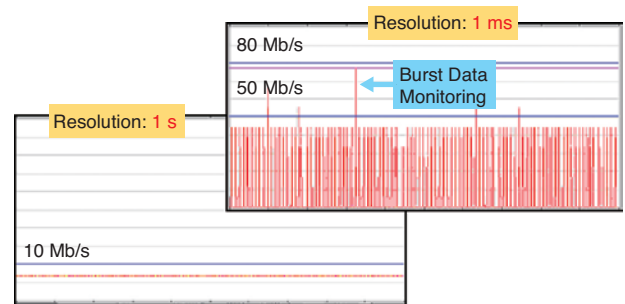

Same Traffic Monitored at Different Resolution

Latency/Packet Jitter

This function supports monitoring of latency and packet jitter, which have serious quality impacts on real-time services.
Latency Distribution

Through Mode

Analysis of packet flows between equipment usually requires splitting the signal. The Through Mode function eliminates the need to provide an external splitter, making packet flow analysis easy.

MP1590B
Packet BER Measurement

Measuring bit errors in transmission paths and frame loss at equipment is an important part of improving network reliability. This Packet BER measurement function plays a key role in assuring transmission quality.

MP1590B

■ Test Packet   ■ Bit Error   ■ Packet Loss
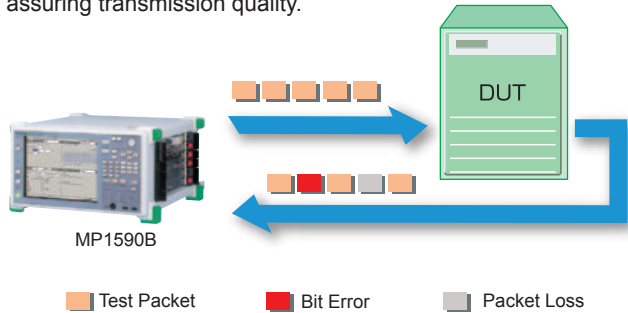

Frequency Measurement

Bit errors and packet loss between equipments are one cause of out-of-specification transfer bit rates (frequencies). This function supports frequency measurement without requiring a dedicated frequency counter.

MP1590B
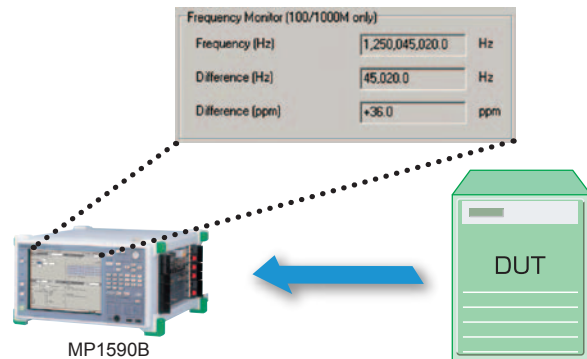

Packet Analysis

Packet Capture

Packet capture is important for analyzing packets when a fault occurs. Powerful packet filtering extracts only the targeted data, which is then saved to internal memory for analysis and display of the packet contents.
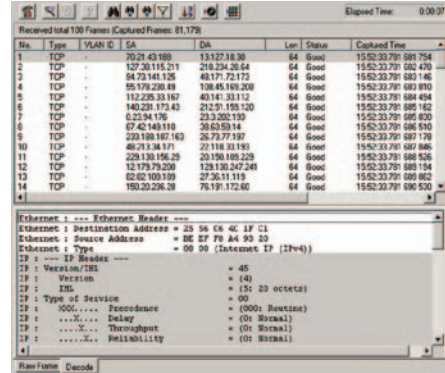

Protocol Decode

The protocol decode function plays a key role in analysis of captured packet. Analysis using both Ethereal® and Wireshark® is supported in addition to the built-in protocol decode functions.

Auto-measurement

RFC2544/RFC2889 Auto-measurement

Switch performance can be measured automatically using the IETF-compliant RFC2544 and RFC2889 tests. The one-touch button operations greatly reduce the time and effort of manual measurements, increasing productivity and efficiency.

Sending text-based command messages to these testers using the remote command interface provides automated control for creating automatic test applications. The remote command interface supports the RS-232C, GPIB, and Ethernet (Option-01, 02, 03) Interfaces.

Report Function

Reports output in HTML format include the measurement conditions and results with graphs for counters, multiflow counters, latency, RFC2544 and RFC2889. Reports can be saved during measurement by using the pause function.

Optical Power Measurement, Optical Attenuation Function

This function measures the average power of the input optical signal when using an optical interface. The optional optical attenuator (Option-04) can attenuate optical output levels up to 30 dB (≤2.6 Gbit/s)/20 dB (≥9953 Mbit/s).
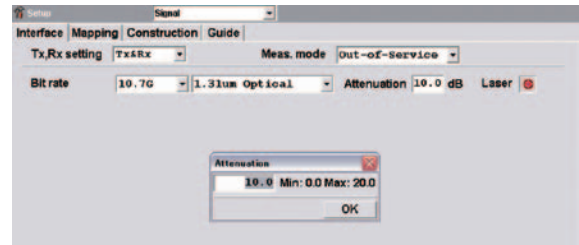

Trigger Output

A received signal can be used as a trigger output to external equipment. The trigger output can be synchronized to the clock output or divided clock output as well as to a frame. For example, linking the trigger output to an external sampling oscilloscope enables the MP1590B to evaluate errors and alarms at the same time the oscilloscope evaluates the waveform.

• MP1590B-30 High Precision Jitter Analysis

Overview	Option for performing calibration of main frame using Phase Analysis calibration method outlined in ITU-T O.172 2005 April Appendix VIII standard with following specifications

Jitter Generation Measurement Accuracy	Accuracy: ±20 mUIp-p (Approaches transmitter jitter (≤100 mUIp-p) standardized by phase analysis calibration method)
	Bit Rate: 9953.28 Mbit/s
	Interface: Optical
	Measurement Condition
	  Optical Input Power: −12 to −10 dBm
	  Measurement Period: 60 s/1 time
	  Measurement Method: phase analysis calibration method (Appendix VIII)
	  Accuracy Calculation: Measured 5 times at 60 s/time to calculate mean of measurement results
	                             Mean value accuracy of ±20 mUIp-p for Tx jitter of 100 mUIp-p max. standardized by phase analysis method
	  Filters: 20 kHz to 80 MHz/50 kHz to 80 MHz (9953 M)
	  Tx Unit: MU150121A/B (9953 M)
	  Frame: Appendix VIII compliant (margin reference format)

Jitter Generation Measurement Repeatability	Accuracy: ±5 mUIp-p (Average of five measurements under constant measurement condition)
	Bit Rate: 9953.28 Mbit/s
	Interface: Optical
	Measurement Condition
	  Optical Input Power: −12 to −10 dBm
	  Measurement Period: 60 s/1 time
	  Measurement Method: Loop-back
	  Filters: 20 kHz to 80 MHz, 50 kHz to 80 MHz/4 MHz to 80 MHz (9953 M)
	  Tx Unit: MU150121A/B (9953 M)
	  Mapping: STS192c/STM-64c-Bulk (PRBS $2^{23} - 1$ Inv.) (9953 M)

Transmitter Output Jitter	Jitter Value: <60 mUIp-p (MU150121A/B)
	Bit Rate: 9953.28 Mbit/s
	Interface: Optical
	Measurement Condition
	  Measurement Method: Phase analysis calibration method (Appendix VIII)
	  Accuracy Calculation: Mean of three measurements
	  Filters: 20 kHz to 80 MHz/50 kHz to 80 MHz (9953 M)
	  Tx Unit: MU150121A/B (9953 M)
	  Sampling Oscilloscope: >20 GHz bandwidth
	  Frame: Appendix VIII compliant (margin reference format)

General Specification	Operating Temperature: 20˚ to 30˚C Recommended Calibration Interval: 1 year after shipment and annually thereafter

Precautions for Option-30

This option can only be installed in the following configurations. Other combinations cannot be installed. (The MU150101A is not supported.)
This option is managed by equipment model and serial number. Accordingly, if it is installed in a unit with the same model number but different serial number, it will be disabled. When changing to a configuration that is different from the configuration with the option installed, the MP1590B functions and performance operate normally based on the switched configuration.

  MP1590B: Network Performance Tester
  MU150110A: Multirate Unit
  MU150121A/B: 10/10.7G Optical (/Electrical) Transmitter Unit (Install either one.)
  MU150123A/B: 10/10.7G Optical (/Electrical) Receiver Unit (Wide)
                (Install either one.)
  MU150125A: 10/10.7G Jitter Unit

The Transmission Output Jitter is specified in the certificate attached to the option. The recommended calibration interval for Option-30 is 1 year after shipment and annually thereafter.

Calculation Method
 (1) Set filter to HP1+LP and measure for 60 s by MU150125A Clock Loop-back.
 (2) Set filter to HP1+LP and measure for 60 s by MU150123A/B + MU150110A/MU150121A/B or MU150125A Optical Interface Loop-back.
 (3) Find difference of measurement results of (1) and (2).
 The value Obtained by (3) is Value of Random Jitter.

*1: Supplied with main frame.
*2: CD includes installer, release notes and operation manual.
*3: Supplied with MU150110A, MU150101A, MU150121A/B, MU150123A/B, and MU150124B.
*4: Two pieces of MU150110A, and MU150101A.
*5: Supplied with MU150123A/B, and MU150124A.
*6: Supplied with MU150101A.
*7: Supplied with MU150125A.
*8: Supplied with MU150121A/B, MU150123A/B, and MU150124B.
*9: One piece of MU150123A/B, and MU150124B, and two pieces of MU150121A/B.
*10: Supplied with MU150110A, and MU150101A.
*11: Supplied with MU150121B.
*12: Supplied with MU150110A.
*13: Requires XFP module (sold separately). In addition, operation with non-Anritsu modules not guaranteed.
*14: An XFP module (G0194A/G0195A) and fixed optical attenuator (J0747C, J1376A) are required when performing the self-test.
*15: One of Option-01, 02, 03 required.
*16: Order additional J1349A when Ethernet unit is installed simultaneously in SDH/SONET/OTN/PDH/DSn unit and jitter unit configurations.
*17: Requires GBIC module (sold separately). In addition, operation with non-Anritsu modules not guaranteed.
*18: Requires XENPAK module (sold separately). In addition, operation with non-Anritsu modules not guaranteed.
*19: Requires SFP module (sold separately). In addition, operation with non-Anritsu modules not guaranteed.
*20: Requires SFP+ module (sold separately). In addition, operation with non-Anritsu modules not guaranteed.
*21: The MP1590B-16 is supported by the MU120118B/C. The MU120138A-03 is supported by the MU120138A.
*22: Only ports 1 and 2 of the the MU120121A/122A support the MP1590B-17 Traffic Impairment Emulator option. Moreover, only MU120121A/122A models shipped after March 7, 2008 with the "Supports Opt.17" sticker support the option.
*23: MP1590B-30 option can be added to the main frame before delivery. But it cannot be added after.
*24: Only enabled for optical output signals up to 2.6G.
*25: Exchangeable.
*26: Requires one of MU150101A-11 or MU150101A-12.
*27: MP1590B-03 not required. However, the maximum number of MP1590B units that can be controlled simultaneously with one licence is limited o 8.
*28: GBIC modules sold as single units. Two can be mounted in MU120112A.
*29: SFP modules sold as single units. Two can be mounted in MU120122A and eight in MU120132A.
*30: XENPAK modules sold as single units. Two can be mounted in MU120118B and one in MU120118C. G0277A, G0192A and G0193A only supported by MU120118A/B/C units with "With APS" sticker. DO NOT install in MU120118A/B/C units without "With APS" sticker. G0277A, G0192A and G0193A have "Only for APS" stickers attached.
*31: SFP+ modules sold as single units. Four can be mounted in MU120138A.
*32: XFP modules sold as single units. One can be mounted in MU150110A.
*33: When using XAUI extender, MZ1222A XENPAK interface, J1163A XAUI cable, and J1164A MDIO cable required along with separate external power supply (5 V, 4 A)
*34: MZ1222A supplied by 1.8-V APS.
*35: G0194A and J1344A included in Z0989A.
*36: G0195A, J1344A, and J1376A included in Z0990A.
*37: Rack mount Kit for MP1590B.
